

GitHub Repository Creation — Step-by-Step with Progress

Goal

Create `https://github.com/GB0GEB/cryo_leak_rate_dashboard` , push v4.0.0, and enable GitHub Pages at `https://gbogeb.github.io/cryo_leak_rate_dashboard/` .

 **Total time: ~10 minutes**

Checklist (follow in order)

Step 1 — Create repository on GitHub

 ~2 minutes

1. [] Open browser: <https://github.com/new> (`https://github.com/new`)
2. [] **Owner:** GB0GEB (your account)
3. [] **Repository name:** `cryo_leak_rate_dashboard`
4. [] **Description:**
`MYRRHA QPLANT Cryogenic Helium Leak Rate Analysis Dashboard v4.0.0`
`Single Source of Truth (SSoT) implementation with 3 HP compressors`
5. [] **Visibility:**
 - ☒ Public (recommended — free GitHub Pages)
 - OR Private (needs GitHub Pro for Pages)
6. [] **Initialize:**
 - ☒ Do NOT add README
 - ☒ Do NOT add .gitignore
 - ☒ Do NOT add license

(We already have these locally — adding them on GitHub will cause a merge conflict)
7. [] Click **Create repository**
8. [] ☒ Mark complete

Expected result: Empty repo at `https://github.com/GB0GEB/cryo_leak_rate_dashboard` .

Step 2 — Copy the push commands GitHub shows you

 ~1 minute

GitHub will display a block like:

```
git remote add origin https://github.com/GB0GEB/cryo_leak_rate_dashboard.git
git branch -M main
git push -u origin main
```

1. ☐ ☒ Copy/note these commands (we'll adapt slightly below)
2. ☐ Keep the GitHub tab open

Step 3 — Execute the push from this chat

 ~2 minutes

Tell the agent **“push to GitHub now”** and it will run, or you can run yourself:

```
cd /home/ubuntu/cryo_leak_rate_dashboard

# 1) Add the remote (only needed once)
git remote add origin https://github.com/GB0GEB/cryo_leak_rate_dashboard.git

# 2) Sanity check
git remote -v

# 3) Push the main branch (sets upstream)
git push -u origin main

# 4) Push all tags (v4.0.0 etc.)
git push --tags origin
```

Watch for:

- Authentication prompt → use a **Personal Access Token (PAT)** with `repo` scope as the password
- Upload progress bar
- A success message ending in `* [new branch] main -> main`

1. ☐ ☒ Mark complete after a clean push

 If the push fails with `Authentication failed`, generate a PAT here:

https://github.com/settings/tokens/new?scopes=repo&description=cryo_leak_rate_dashboard (https://github.com/settings/tokens/new?scopes=repo&description=cryo_leak_rate_dashboard)

Step 4 — Verify on GitHub

 ~1 minute

1. ☐ Refresh the repo page on GitHub
2. ☐ Confirm these top-level entries are visible:
 - ☐ `src/`
 - ☐ `docs/`
 - ☐ `data/`
 - ☐ `tests/`
 - ☐ `scripts/`
 - ☐ `README.md`
 - ☐ `CHANGELOG.md`

- [] `VERSION` , `VERSION.json`
 - [] `BACKUP_STRATEGY.md` , `PROGRESS_TRACKER.md`
 - 3. [] Check **commits** tab — most recent commit should match local `git log`
 - 4. [] Check **tags** — `v4.0.0` should be present (if previously tagged)
 - 5. [] ☒ Mark complete when verified
-

Step 5 — Enable GitHub Pages

 ~3 minutes

1. [] Go to: `https://github.com/GB0GEB/cryo_leak_rate_dashboard/settings/pages`
 2. [] Under **Build and deployment**:
 - **Source**: Deploy from a branch
 - **Branch**: `main`
 - **Folder**: `/docs`
 3. [] Click **Save**
 4. [] Wait 2–3 minutes for the first deployment (watch the **Actions** tab if curious)
 5. [] Refresh the Pages settings page — you should see:
 - ✓ Your site is live at `https://gbogeb.github.io/cryo_leak_rate_dashboard/`
 6. [] Click that URL — it should load your dashboard
 7. [] ☒ Mark complete
-

Step 6 — Test the live deployment

 ~2 minutes

Open each URL in the browser and confirm it loads (no 404, no broken layout):

1. [] `https://gbogeb.github.io/cryo_leak_rate_dashboard/`
2. [] `https://gbogeb.github.io/cryo_leak_rate_dashboard/VERSION_SELECTOR.html`
3. [] `https://gbogeb.github.io/cryo_leak_rate_dashboard/NAVIGATOR.html`
4. [] `https://gbogeb.github.io/cryo_leak_rate_dashboard/index_v4_0.html`
5. [] `https://gbogeb.github.io/cryo_leak_rate_dashboard/STAKEHOLDER_PRESENTATION.html`
6. [] One Plotly plot, e.g. `.../plots/plot1_leak_vs_loss.html`
7. [] ☒ Mark complete

 If any HTML loads but Plotly figures are blank, hard-refresh (Ctrl+Shift+R) — GitHub Pages aggressively caches the first deployment.

☒ Success criteria

- [x] Repository created on GitHub
- [x] All files pushed and visible
- [x] Tags pushed (`v4.0.0`)
- [x] GitHub Pages enabled

- [x] Site accessible at `gbogeb.github.io/cryo_leak_rate_dashboard/`
- [x] All landing HTML pages load correctly
- [x] No 404 errors on the smoke-test URLs above

When all the above are ticked, update `PROGRESS_TRACKER.md` and you're done. 🎉
