

Project Reuse Guide — Future Chat Sessions

How to pick the `cryo_leak_rate_dashboard` project back up in a brand-new chat session, without losing context or re-doing setup.

Scenario: Starting a new chat session

You closed the previous chat (or the VM timed out). The project files in `/home/ubuntu/` from that chat are no longer guaranteed to exist. Here's how to restart cleanly.

Option 1 — Clone from GitHub (RECOMMENDED)

When to use: After you've pushed the repo to GitHub (see `GITHUB_REPO_CREATION_STEPS.md`).

```
# In the new Abacus AI Agent chat:
git clone https://github.com/GB0GEB/cryo_leak_rate_dashboard.git
cd cryo_leak_rate_dashboard

# 1) Recreate the Python venv and install deps
./setup.sh

# 2) Rebuild all derived artifacts (HTML, plots, manifest, handover)
./build.sh

# 3) Verify everything is healthy
./validate.sh
```

Benefits

-  Latest version from GitHub
-  Full git history
-  Collaborator changes included
-  Fast setup (~2 minutes)

Option 2 — Upload a local ZIP backup

When to use: No GitHub repo yet, or you're offline.

```
# 1) Upload the ZIP through the chat UI
# 2) Then in the chat shell:

unzip cryo_leak_rate_dashboard.zip -d /home/ubuntu/
cd /home/ubuntu/cryo_leak_rate_dashboard

# 3) Sanity check git state
git status

# 4) Set up env and rebuild
./setup.sh
./build.sh
```

Benefits

-  Works without GitHub access
-  Captures any local-only uncommitted changes
-  May be outdated relative to GitHub if others pushed updates

What to bring into the new chat

Essential (only if NOT using GitHub)

1. Full project ZIP
2. Any uncommitted changes you care about
3. Environment notes (Python version, OS quirks if any)

Reference docs to point the new agent at

1. `HANDOVER.md` — project overview
2. `BUILD_LOG.md` — build history
3. `CONTINUATION_GUIDE.md` — agent continuation instructions
4. `BACKUP_STRATEGY.md` — persistence rules
5. `PROGRESS_TRACKER.md` — where we left off in the deployment process

Nice to have

1. `ARTIFACTS.yaml` — deliverables catalog
2. `QUICK_ACCESS.md` — frequently used URLs and commands
3. `CHANGELOG.md` — version history

Handover message template

Paste this at the start of the new chat to give the agent full context:

```
Continue work on MYRRHA QPLANT Cryogenic Dashboard

**Project:** cryo_leak_rate_dashboard
**GitHub:** https://github.com/GBOGEB/cryo_leak_rate_dashboard
**Version:** v4.0.0
**Status:** Deployed to GitHub Pages

**Context**
- Single Source of Truth in `data/config.yaml`
- 3 HP compressors (Kaeser FSD 575 SFC)
- 22/22 tests passing
- All documentation complete
- GitHub Pages live at https://gbogeb.github.io/cryo_leak_rate_dashboard/

**Task**
<your next task here>

**Reference**
- HANDOVER.md for project overview
- BUILD_LOG.md for history
- CONTINUATION_GUIDE.md for agent instructions
```

Quick commands reference

Start working

```
git clone https://github.com/GB0GEB/cryo_leak_rate_dashboard.git
cd cryo_leak_rate_dashboard
./setup.sh
```

Make changes

```
# Edit files...
./build.sh           # Rebuild HTML/plots/manifest
./validate.sh        # Run tests + link/manifest checks
git add .
git commit -m "feat: <message>"
git push
```

Deploy updates to GitHub Pages

GitHub Pages auto-deploys from `main` after each push to `/docs/`.

For an explicit redeploy or smoke test:

```
./scripts/deploy.sh
```

Create a new release

```
./scripts/release.sh v4.0.1
git push --tags origin
```

Pre-push safety net

Always run before a push that touches deployment:

```
./scripts/pre_push_checklist.sh
```

Things to remember between sessions

Detail	Value
GitHub owner	GB0GEB
Repo name	cryo_leak_rate_dashboard
Default branch	main
Pages source	main branch, /docs folder
Live URL	https://gbogeb.github.io/cryo_leak_rate_dashboard/
Local path	/home/ubuntu/cryo_leak_rate_dashboard
Current version	v4.0.0
Python venv	./venv/ (recreate with ./setup.sh)
Test runner	pytest tests/
Build entrypoint	./build.sh (calls src/build_all.py)
