

AMBIGUITY FIXES

Audit date: 2026-05-12

Version: v4.0.0

Purpose: Identify and remediate sources of confusion in file naming, content, and navigation.

Issues Found & Remediation

Issue 1: Multiple “index” files causing confusion — FIXED

Before:

docs/index.html	← Landing hub (v3.1.0 label)
docs/index_v3.html	← v3.0 master (stale)
docs/index_v3_1.html	← v3.1 master (stale, 4-compressor data)
docs/index_v4_0.html	← v4.0 master (canonical)

A new user arriving at `index.html` would see v3.1.0, not know which “index” is current.

After (this session):

docs/index.html	← Landing hub (now v4.0.0) 
docs/index_v4_0.html	← Canonical master 
docs/NAVIGATOR.html	← NEW quick-access navigator 
docs/archive/index_v3_0_0_ARCHIVE.html	← Archived with deprecation banner
docs/archive/index_v3_1_0_ARCHIVE.html	← Archived with deprecation banner
docs/archive/presentation_v2_5_0_ARCHIVE.html	← Archived with deprecation banner

Issue 2: No `<meta name="dashboard-version">` in auto-generated pages — DOCUMENTED

Problem: 6 auto-generated triage pages (`dashboard.html` , `executive_summary.html` , `calculations.html` , `rtm_traceability.html` , `handover.html` , `triage_compliance.html`) have no machine-readable version tag.

Current status: These files have no `<meta name="dashboard-version">` tag. The only version indicator is text content within the pages.

Remediation: Add to `src/generate_dashboard.py` → `_page()` function:

```
<meta name="dashboard-version" content="{version}"/>
```

Priority:  Medium — add during next rebuild cycle.

Issue 3: `visualizations_v3/` name implies v3 data — CLARIFIED

Problem: Directory name `visualizations_v3` suggests v3.0 data, but 4 charts contain v4.0.0 compressor data (updated 2026-05-10), while 17 others are pure physics charts independent of version.

Remediation:

- Added `docs/visualizations_v3/README.md` explaining the naming convention ✓
- The “v3” in the directory name refers to the **generator version** (`generate_visuals_v3.py`), not the data version
- **No rename needed** — renaming would break existing links in `index_v4_0.html` and other pages

Issue 4: `docs/plots/` vs `docs/visualizations_v3/` overlap — ⚠ DOCUMENTED

Problem: Two directories contain leak-rate charts with similar (but not identical) content:

- `docs/plots/plot1_leak_vs_loss.html` — core triage plot (auto-generated by `generate_dashboard.py`)
- `docs/visualizations_v3/chart_leak_vs_loss_extended.html` — extended version (by `generate_visuals_v3.py`)

Similarly:

- `docs/plots/plot4_fleet_sensitivity.html` vs `docs/visualizations_v3/chart_valve_fleet_sensitivity.html`

Not a conflict: The `plots/` versions are simpler, embedded in triage dashboards. The `visualizations_v3/` versions are extended/detailed for specialist use. Different audience, different detail level.

Remediation: No action needed. Documented in `NAVIGATOR.html` — `plots/` = “Core Triage Plots”, `visualizations_v3/` = “Advanced Analytics”.

Issue 5: Hero pages lag behind — ⚠ DOCUMENTED

Problem: 7 hero pages in `docs/heroes/` are v3.0-era audience-specific landing pages. They don’t reference the current version, SSoT, or compressor configuration.

Risk assessment: LOW — hero pages contain valve-level data only. No compressor count, no system CAPEX, no conflicting numbers. They are excluded from stakeholder distribution.

Remediation:

- Not included in any distribution bundle (documented in `NAVIGATOR` under “Technical Documentation”)
- Future: create `src/build_heroes.py` to auto-generate from SSoT
- **Priority:** ● Low — no data conflicts, no stakeholder exposure

Issue 6: `docs/tables/` vs `outputs/tables/` — ⚠ DOCUMENTED

Problem: Two directories with “tables”:

- `docs/tables/` — 4 standalone HTML table pages (v3.0 era)
- `outputs/tables/` — current CSV/JSON table exports (v4.0.0 data)
- `docs/tables_v3/` — 13 CSV files used by `visualizations_v3`

Potential confusion: Which is the authoritative table data?

Answer: `outputs/tables/` is the current build output. `docs/tables/` is legacy presentation. `docs/tables_v3/` is intermediate data for chart generation.

Remediation: No rename — just documented in `NAVIGATOR` and `STALE_FILES_AUDIT`.

Issue 7: `STAKEHOLDER_PRESENTATION.html` references v3.1.0 — **ACCEPTABLE**

Context: References are in the form “CORRECTED from 4 units in v3.1.0” and “€200k saved vs v3.1.0” — these are **corrections pointing to the old version**, not stale data. This is correct and provides audit trail.

Issue 8: Missing SSoT reference in canonical files — **DOCUMENTED**

Problem: Neither `index_v4_0.html` nor `STAKEHOLDER_PRESENTATION.html` reference `data/config.yaml` as SSoT.

Remediation:

- NAVIGATOR.html now prominently features `config.yaml` as SSoT 
- Future: Add SSoT footer badge to canonical presentations
- **Priority:**  Medium

Summary of Actions Taken

Issue	Status	Action
Multiple index files	 Fixed	Archived v3.0/v3.1/v2.5 with banners
No version meta tags	 Documented	Future: add to <code>_page()</code> in generator
visualizations_v3 naming	 Clarified	Added README.md
plots/ vs visualizations_v3/ overlap	 Clarified	Documented different purposes
Hero pages lag	 Documented	Low risk, future auto-generation
tables/ ambiguity	 Documented	Clarified in audit
v3.1 references in current files	 Acceptable	Contextual correction references
Missing SSoT reference	 Documented	NAVIGATOR now includes SSoT

Remaining Ambiguity Risk: LOW

After this cleanup, a new user can:

1. Open `docs/NAVIGATOR.html` → see all deliverables organized by category

2. See canonical presentations clearly marked with ★
3. Understand archive files have deprecation banners
4. Find the SSoT (`config.yaml`) in the Data & Configuration section
5. Know which files are auto-generated vs hand-curated
