

GitHub Pages Setup Guide — NEXT STEP

Goal

Deploy live website at: https://gbogeb.github.io/cryo_leak_rate_dashboard/

Time Required: 5 minutes

Step-by-Step Instructions

Step 1: Navigate to Pages Settings

 30 seconds

1. Go directly to:

https://github.com/GBOGEB/cryo_leak_rate_dashboard/settings/pages

Or: Repository → **Settings** tab → scroll to **Pages** in left sidebar (under “Code and automation”)

Step 2: Configure Source

 1 minute

In the “**Build and deployment**” section:

1. **Source:** Select “**Deploy from a branch**” (not “GitHub Actions”)
2. **Branch:**
 - Dropdown 1: Select `main`
 - Dropdown 2: Select `/docs`
3. Click “**Save**”

You should see:

 Your site is being published from the `/docs` folder in the main branch

Step 3: Wait for Deployment

 2-3 minutes

GitHub will build and deploy your site. **Refresh the page after 2 minutes.**

You should see:

 Your site is live at https://gbogeb.github.io/cryo_leak_rate_dashboard/

Step 4: Verify Your Site

 2 minutes

Visit: https://gbogeb.github.io/cryo_leak_rate_dashboard/

Test these URLs:

- [] Main: `.../` → VERSION_SELECTOR landing page

- [] Navigator: `.../NAVIGATOR.html`
- [] Technical: `.../index_v4_0.html`
- [] Executive: `.../STAKEHOLDER_PRESENTATION.html`
- [] Visualizations: `.../visualizations_v3/compressor_availability_comparison.html`
- [] Hero: `.../heroes/executive.html`

All should load without 404 errors.

Success Criteria

Your deployment is successful when:

- [x] GitHub shows “Your site is live at...”
 - [x] Main URL loads VERSION_SELECTOR
 - [x] Navigation links work
 - [x] Presentations display correctly
 - [x] Visualizations render (Plotly charts)
 - [x] No 404 errors
-

Troubleshooting

Issue: “None” option in branch dropdown

Solution: Wait 1 minute and refresh. GitHub is indexing your repo.

Issue: 404 on site URL

Solutions:

1. Wait 3-5 minutes (deployment in progress)
2. Check branch is “main” and folder is “/docs”
3. Verify `docs/` folder exists in repo
4. Clear browser cache

Issue: Pages option not in Settings

Solution: Verify repository is **public** (Pages requires public repo or GitHub Pro)

After GitHub Pages Setup

1. **Test thoroughly** — all links, visualizations
2. **Create GitHub Release** — `v4.0.0` tag
3. **Share URLs** with stakeholders
4. **Add workflow permissions** — to enable CI/CD
5. **Set up custom domain** (optional)
